Supplementary Figure 2. Associations of childhood body mass index at age 7 and 13 years with risks of intracerebral hemorrhage among women and men diagnosed within the last 10 years of follow-up. Hazard ratios and 95% confidence intervals (CIs) are given for a 1-unit increase in body mass index (BMI) z-score. All analyses are stratified by birth cohort. (A) Women, 7 years. (B) Men, 7 years. (A) Women, 13 years. (B) Men, 13 years.
